

How to work with **Projects**?

A **Project** can be used to organize content

A Project lists its dependencies as Requirements

Specific behaviour is de-coupled in **Roles** or **Collections**

A Project is stored in a Git repository

Project layout

<code>ansible.cfg</code>	<code># parameters that affect running</code>
<code>playbook.yml</code>	<code># main playbook</code>
<code>collections/</code>	
<code>requirements.yml</code>	<code># ansible-collection dependencies</code>
<code>files/</code>	<code># 'files' is used for relative paths</code>
<code>static.txt</code>	<code># file for use with the copy action</code>
<code>script.py</code>	<code># script to use with the script action</code>
<code>galaxy/</code>	<code># roles imported from galaxy</code>
<code>group_vars/</code>	<code># project variables can be encrypted</code>
<code>db/</code>	<code># db corresponds to an inventory group</code>
<code>secrets</code>	<code># ansible-vault encrypted file</code>
<code>library/</code>	<code># python libraries</code>
<code>requirements.txt</code>	<code># python library dependencies</code>
<code>roles/</code>	<code># in-project roles</code>
<code>myrole/</code>	<code># this hierarchy represents a "role"</code>
<code>defaults/</code>	<code># defaults can be overridden</code>
<code>main.yml</code>	<code># contains values for variables</code>
<code>tasks/</code>	<code># actions that drive modules</code>
<code>main.yml</code>	<code># could include other files</code>
<code>handlers/</code>	<code># can be notified by tasks on change</code>
<code>main.yml</code>	<code># defines state after change</code>
<code>templates/</code>	<code># for use with the template module</code>
<code>hosts.j2</code>	<code># Jinja2 can be used</code>
<code>requirements.yml</code>	<code># list of ansible-role dependencies</code>
<code>templates/</code>	<code># template file overrides</code>
