Invoke State Change

If we use variables in a good way we can drive the whole thing with extra vars.

```
$ molecule converge -- -e package=httpd
$ molecule converge -- -e desired_state=absent
$ molecule converge -- -e package=nginx
```

Manage a package

```
$ vim defaults/main.yml
---
# defaults file
desired_state: present
package: httpd

$ vim vars/absent.yml
---
# Variable values for desired_state: absent
package_clause: "not in"
service_state: stopped
systemd_state: stopped
systemd_enabled: false

$ vim vars/present.yml
---
# Variable values for desired_state: present
package_clause: "in"
service_state: running
systemd_state: started
systemd_enabled: true
```
